

REJUVI TATTOO REMOVAL AFTERCARE INSTRUCTIONS

(PERMANENT MAKEUP / COSMETIC TATTOOS)

- 1.** The treated area should remain completely dry at all times. In case of dampness due to ooze of white blood cells or accidental contact with water use a cotton bud to press the treated area gently to remove water.
- 2.** A brownish crust or scab will form over the treated area after a few days and will peel off naturally in 7 - 14 days. **Do not** pick or pull at the crust prematurely as that will increase the risk of scarring and prolong the recovery time. Use bandage or tape to cover the treated area temporarily for taking a shower. No swimming, spas, soaking or steaming. Contact with water for a short time (1 - 2 minutes) might be ok after the first 3 days, but no contact with soap or direct contact with shower spray until crust has peel off naturally. After any water contact use dry and clean cotton pad to press gently the crust to remove water then let the area air dry. Do not allow crust to get softened by moisture.
- 3.** In case of infection, sterilize with 2% hydrogen peroxide and then apply antibiotic ointment such as “Bacitracin” on the skin at the edge of the crust. If the infection still remains take antibiotic tablets (consult with your doctor for a prescription for antibiotics). Always consult with your doctor if you suspect you may have an infection.
- 4.** After the crust peels off naturally, the treated skin area will show a significant redness which will remain on the skin for several weeks and will gradually return to normal skin colour in 2 – 3 months. Apply Rejuvi “h” Super Soothing Cream (in your aftercare pack) immediately after the crust peels off and each time after washing to diminish redness and speed up skin recovery.
- 5.** In case itchiness develops in the treated area during skin recovery period, do not scratch the skin. You may tap the skin to relieve itchiness and apply an anti-itch ointment (available at pharmacies). Excessive scratching on the treated area during the healing process might cause scarring.
- 6.** If the colour is not completely removed at certain areas, the removal process may be repeated again after the skin has healed well (usually after 2 months).
- 7.** The treated area can be re-tattooed after the skin has healed well (usually after 2 months).

If you have any questions about the aftercare for your tattoo removal please feel free to contact me.
